PREFACE

The development of the offshore petroleum industry is a remarkable story of inventiveness, entrepreneurship, hard work, and risk-taking that turned Louisiana's relatively isolated coastal communities into significant contributors to the U.S. and global economies. This industry emerged as local residents and returning World War II veterans applied skills, technologies, and can-do attitudes to overcome the many challenges of producing oil from below the ocean floor. Offshore workers initially came from Texas, Oklahoma, and Louisiana, but soon people from throughout the United States were attracted to the Gulf Coast. This industry, born in the Louisiana marshes, has grown to have a key place in the modern world. Yet, it is little known, understood, or documented, and its dynamic economic role is virtually invisible.

To explore the history and evolution of this industry and the people and communities where it was born, in 2001 the U.S. Minerals Management Service (MMS) sponsored a study to examine the historical evolution of the offshore oil and gas industry and its effects on Louisiana's coastal culture, economy, landscape, and society. The study represented the convergence of the ideas of several people who recognized that an important piece of history – the origins of the offshore petroleum industry – was being lost and that capturing it would require the use of published works, periodicals and other documents, and oral histories. The idea for the study was supported by the Social Science Subcommittee of the MMS Scientific Committee, staff from MMS Headquarters and the Gulf of Mexico Region office in New Orleans, members of the business and academic communities, and Louisiana civic leaders and educators. As a result, researchers from universities in Louisiana, Texas, and Arizona came together to trace the development of the

1. INTRODUCTION

From 2001-2005 the U.S. Minerals Management Service sponsored a study to examine the historical evolution of the offshore oil and gas industry and its effects on Louisiana's coastal culture, economy, landscape, and society. Researchers from universities in Louisiana, Texas, and Arizona came together to trace the development from land and marsh to state waters and across the Outer Continental Shelf. As one component of this project, university and community

1.2. The Photographs

Each photograph provides a unique look at the offshore oil and gas industry and its impacts on workers, their families, and their communities. The photographs are organized by donor; the donors are organized alphabetically by last name. Thumbnails of the images are grouped together in numerical order. Researchers interviewed the donors about their photographs and recorded information about each photo. A brief description of each photo is included in the list of photographs in Chapter 3. In most cases during the interview, additional information was provided as context for the photo. Many of the photo interviews were recorded on audio tape or disc as well as in written notes.

The tapes and discs onto which all interviews associated with this project were recorded and paper copies of the transcripts of those interviews are available in the archives of the Louisiana State University, University of Houston, University of Louisiana at Lafayette, and Nicholls State University. Copies of these materials can be obtained by contacting the archivists of these institutions.
