Fees are based on number of sites in the submission; e.g., a thorax and abdomen, views obtained on separate time points (days or hours apart), or stifle plus pelvis are each considered 2 sites, even if both are visible on the same images. A single site on an appendicular skeleton study should be collimated to a long bone with its proximal and distal joint included or a joint with a portion of adjacent long bones included. All sites on submitted images sent will be reported and charged. **Due to ethical considerations, we will not report on some images, while excluding other images in the same submission; please submit only those images/sites requiring reporting.**
